

# WELLINGTON CITY'S 2013 CLIMATE CHANGE ACTION PLAN

---

## MESSAGE FROM THE MAYOR

In July 2013, Sir Peter Gluckman, Chief Science Advisor to the Prime Minister, released a climate change assessment for New Zealand. He writes:

*“There is unequivocal evidence that the Earth’s climate is changing, and there is strong scientific agreement that this is predominantly as a result of anthropogenic greenhouse gas emissions.”*

With significant climate impacts projected for our environment and economy, he makes the case that New Zealand must prepare for change. Our vulnerability to droughts and extreme storms has been driven home in the past year, and Wellington has just had its warmest winter on record. The climate change impacts we have seen so far are modest compared to those in other countries and the impact on the global economy.

As climate science advances and we experience the realities of climate change, climate change action is shifting into the mainstream and is becoming a great opportunity as well as a challenge.

This 2013 edition of Wellington City’s Climate Change Action Plan builds on our accomplishments under the previous award-winning plan: increasing local renewable generation, insulating homes, improving energy efficiency, investing in public transport and encouraging more people to walk and cycle, trialling electric vehicles, planting more trees and managing pests, increasing recycling and composting, and researching the impacts of a changing climate on our city.

The plan sets out new initiatives that will help us to achieve the goals of our strategy *Wellington Towards 2040: Smart Capital*. These include:

- implementing Smart Energy Capital, which co-funds innovation in reducing energy use
- participating in the UN-Habitat City Resilience Profiling Programme and UNISDR Making Cities Resilient campaign

- enhancing Wellington’s role as a centre of excellence for urban planning, resilience and ecological sustainability
- exploring opportunities for reducing emissions through an update of the Wellington Transport Strategy
- increasing the involvement of all communities in activities for climate change mitigation and adaptation.

Above all, this plan is about working together as a city to safeguard our quality of life, our economic development and natural capital. In 2012, Wellington won a first-place prize in the International Awards for Liveable Communities. The actions we take now on climate change will help determine the liveability of our beautiful city for generations to come.

Meeting Wellington’s ambitious climate change objectives will require a major change in investment choices as part of – not instead of – our economic growth. We need to find cost-effective ways to increase renewable generation, make homes and buildings more efficient, shift to low-carbon transport and enhance our forests. In the longer term, we need to shape our responses to sea-level rise, whether through accommodation, strategic use of natural or engineered defences or retreat. Improving our resilience is vital.

In the coming year, the Council plans to launch major engagement with the public and stakeholders on climate change mitigation and adaptation, to build support and commitment to action. We also expect to continue our efforts as an advocate for regional, national and international action on climate change.

We cannot respond to these challenges with ‘more of the same’. Instead, let us work together as a city to unlock the changes that will put us on a pathway toward resilient low-carbon development.

A handwritten signature in dark ink, reading 'Celia Wade-Brown'.

**Wellington Mayor Celia Wade-Brown**  
**October 2013**

# OVERVIEW

1. For Wellington to thrive in a future of growing carbon constraints and climate impacts, we need to take action to reduce our greenhouse gas emissions and vulnerability to extreme weather events and sea-level rise. Wellington is responding to this challenge through mitigation and adaptation initiatives in the Council and the community.
2. The actions we have taken since 2010 are helping to limit emissions growth in the context of an expanding population and economy. They are also improving our quality of life, enhancing resilience, creating business opportunities and helping to establish Wellington as a centre of excellence for urban planning, resilience and ecological sustainability.
3. In the 2013 Climate Change Action Plan, we are extending and improving existing initiatives and integrating new ones. Highlights include Smart Energy Capital, an update of the Wellington Transport Strategy, participation in UN resilience programmes and enhanced research partnerships.
4. Both the city and the Council have ambitious emissions-reduction targets. By 2020, the city aims for a 30 percent reduction from 2001 levels and the Council a 40 percent reduction from 2003 levels. By 2050, both the city and Council aim for an 80 percent reduction relative to the respective base year.
5. Achieving these targets and longer-term objectives for change will require major shifts in the investments and choices we make as Wellingtonians.
6. To help lead this change, the Council proposes to target areas where most gains can be made: how we generate energy and use it in our homes and buildings, how we manage transport challenges, how we enhance our forests and get the most benefits from compact development.
7. The 2013 plan provides a starting point for public and stakeholder engagement in the coming year. Our aim is to gain broad support for resilient low-carbon development from businesses, communities and Māori, as well as household and organisational commitment to action. We want to leverage public and private investment and create new partnerships for change.
8. Wellington will need supporting policies from, and partnerships with, regional and central government to achieve its ambitious climate change goals. The Council will advocate for improving regional and national policies that have implications for climate change mitigation and adaptation.

# CLIMATE CHANGE ACTION IS SMART ACTION FOR NEW ZEALAND’S CAPITAL

QUALITY OF LIFE	ECONOMIC DEVELOPMENT	RESILIENCE
<div>Making our homes warmer, drier and healthier while reducing energy bills</div>		
<div>Making our commercial buildings more efficient, resilient and competitive</div>		
<div>Increasing energy security through renewable power generation: wind, solar, geothermal, landfill gas and marine</div>		
<div>Using smart grid technologies to optimise energy use</div>		
<div>Increasing public and active transport, changing our driving habits and using more efficient cars and low-carbon transport fuels</div>		
<div>Waste avoidance, reuse, recycling and composting</div>	<div>Using water more efficiently</div>	
<div>Serving as a centre of excellence for urban planning, resilience and ecological sustainability</div>		<div>Engaging with communities</div>
<div>Enhancing green infrastructure and biodiversity: planting trees, maintaining green corridors and managing pests</div>		
<div>Preparing for the impacts of sea-level rise and extreme weather events</div>		
<div>Advocating for improvements to regional, national and international policies</div>		

# WELLINGTON CITY'S 2013 CLIMATE CHANGE ACTION PLAN

PRIORITIES FOR 2013–2015	
Adaptation	<ul style="list-style-type: none"> <li>▪ Research climate impacts in Wellington</li> <li>▪ Integrate adaptation into strategic resilience planning</li> <li>▪ Engage with communities and stakeholders on risk and resilience</li> <li>▪ Implement water-sensitive urban design</li> </ul>
Buildings and energy	<ul style="list-style-type: none"> <li>▪ Implement the Smart Energy Capital fund</li> <li>▪ Implement NABERS NZ™ (energy efficiency) benchmarking</li> <li>▪ Extend Home Energy Saver</li> <li>▪ Extend Warm Up Wellington</li> <li>▪ Develop a rental housing warrant of fitness</li> <li>▪ Incentivise solar energy development</li> </ul>
Land transport and shipping	<ul style="list-style-type: none"> <li>▪ Improve public transport and road networks, and encourage more walking and cycling</li> <li>▪ Support compact city development</li> <li>▪ Promote efficient vehicle technology and low-carbon fuels</li> </ul>
Waste	<ul style="list-style-type: none"> <li>▪ Investigate improved methods of sewage sludge treatment</li> <li>▪ Develop a regional waste education strategy</li> <li>▪ Improve packaging product stewardship</li> <li>▪ Expand Kai to Compost</li> </ul>
Council operations	<ul style="list-style-type: none"> <li>▪ Optimise the vehicle fleet</li> <li>▪ Verify and benchmark corporate emissions</li> <li>▪ Develop an energy management strategy</li> <li>▪ Implement the Karori Recreation Centre solar project</li> <li>▪ Improve water conservation and efficiency</li> <li>▪ Strengthen research partnerships</li> <li>▪ Update the Carbon Management Policy</li> </ul>
Forestry	<ul style="list-style-type: none"> <li>▪ Enhance forest carbon sinks</li> <li>▪ Extend pest management</li> <li>▪ Enhance local government forestry partnerships</li> </ul>
Aviation	<ul style="list-style-type: none"> <li>▪ Investigate emissions-reduction options under the proposed extension of the airport runway</li> <li>▪ Develop an agreement with Wellington International Airport</li> <li>▪ Advocate for climate mitigation in the aviation sector</li> </ul>
2020 emissions-reduction target	<ul style="list-style-type: none"> <li>▪ Target areas where most gains can be made</li> <li>▪ Measure our progress</li> <li>▪ Increase community ownership, investment and action</li> <li>▪ Advocate for progress beyond Wellington</li> </ul>

# INTRODUCTION

## CLIMATE CHANGE: A GLOBAL AND LOCAL CHALLENGE

The climate has always shaped Wellington's way of life and helped to define our character. We are world famous for our wind, green spaces, harbour and exposed, rugged coastline.

Globally, significant and sustained changes to the climate system are being caused by emissions of greenhouse gases from human activity. If emissions trends continue, changes such as higher temperatures, more frequent extreme weather events and sea-level rise will have serious and, in some cases, irreversible impacts on our environment, health, economy and society. Although countries have agreed on a long-term goal to limit temperature rises to no higher than 2°C above pre-industrial levels, increasing global emissions threaten to push this goal out of reach. Negotiations between countries are ongoing and the Intergovernmental Panel on Climate Change will issue its next comprehensive assessment report in 2014.

Leadership will be essential to deliver the required change in global emissions and prepare for the impacts of climate change. This includes local government, which shapes

urban design and land-use planning, guides local economies and operates closest to the point of production, consumption and climate impacts.

Responding to climate change, however, is not just a matter of government policy. It is also up to individuals, organisations and communities to take meaningful and responsible action. We all have a part to play in the choices we make as producers, consumers and advocates for change.

---

## RESPONDING TO CLIMATE CHANGE

**Adaptation** means preparing for the impacts of climate change so we can safeguard the community, environment and economy from likely risks.

**Mitigation** means avoiding or reducing greenhouse gas emissions or storing (sequestering) carbon dioxide in forests or geological formations.

---

## WELLINGTON'S APPROACH TO CLIMATE CHANGE

Wellington City's approach to climate change will affect how we thrive as a city, demonstrate leadership and support our international reputation. Smart actions we take will also enhance our quality of life, economic development and resilience. These can:

- help make our city's environment, economy and society more adaptable to change
- promote biodiversity, effective land-use planning and improved air and water quality
- safeguard health
- improve housing quality and transport
- provide secure sources of energy
- make our commercial buildings more competitive by being more efficient
- reduce waste and inefficient use of non-renewable resources
- provide incentives for technological innovation
- generate new business opportunities.

For the past decade, Wellington City Council has been committed to reducing the city's greenhouse gas emissions and planning for the effects of climate change. The Council published a Climate Change Action Plan in 2007 and an update in 2010 that was a category award-winner in the Ministry for the Environment's Green Ribbon Awards 2011. We have set ambitious emissions-reduction targets through until 2050. These are absolute targets and not linked to population or economic growth.

This plan builds on the progress made in the broader context of the city's *Wellington Towards 2040: Smart Capital* strategy. It extends and improves measures started in 2010, and integrates more recent initiatives that will boost our effectiveness and improve how we measure progress.

Two main features of the plan are: more emphasis on engaging with the public and stakeholders, and active partnerships on climate change mitigation and adaptation to 2015 and beyond.

### Greenhouse gas emissions-reduction targets for Wellington City and Wellington City Council

	BASE YEAR		2010 (2009–2010)	2013 (2012–2013)	2020 (2019–2020)	2050 (2049–2050)
Wellington City	2001 (2000–2001)	Stabilise (0% increase)		-3%	-30%	-80%
Wellington City Council	2003 (2002–2003)	Stabilise (0% increase)		NA	-40%	-80%

## TAILORING SMART CLIMATE ACTION TO THE SMART CAPITAL

The 2013 Climate Change Action Plan is designed to accommodate the city's geography, climate and economy.

Wellington can boast having over 200sq m of green space for every person. As a hilly, coastal city close to the intersection of two major tectonic plates, Wellington experiences considerable seismic activity and intense weather.

Most residents live within 3km of the sea, and significant parts of the city's infrastructure and economy are at risk from sea-level rise and tsunamis.

Wellington's geographic location provides a critical transport link between the North and South Islands. It maintains strong national and international connections through an international airport and a busy commercial and ferry port. Wellington has an exceptionally high quality of life, as reported by its citizens in regular surveys. Wellington was awarded first place in our category in the 2012 International Awards for Liveable Communities.

The city has some important features that support effective climate action. In particular:

- there is access to renewable electricity generation within the city and from the national grid

- our compact design, extensive public transport network, footpaths and cycleways help to reduce car use and improve travel efficiency in a city with a growing population and economy
- our local economy is dominated by service industries, creating opportunities for low-emission economic development and links to clean-tech and knowledge-based global markets
- new commercial buildings are reflecting market demand for competitiveness and efficiency as shown by Green Star ratings
- the city has world-class universities and institutions engaged in research on mitigating and adapting to climate change
- improving our resilience to natural events is important to our government institutions, businesses and communities.

In the 2010 Nielsen Quality of Life survey (which involves the eight major cities in New Zealand), 82 percent of Wellingtonians agreed or strongly agreed that they would change their lifestyle to help prevent global warming if they knew it would make a difference. This compares to 76 percent for the eight cities as a group.<sup>1</sup>

---

## CLIMATE IMPACTS FOR WELLINGTON

In July 2013, Sir Peter Gluckman, Chief Science Advisor to the Prime Minister, released an overview of the projected impacts of climate change for New Zealand. An increase of 1°C has been observed since 1910. New Zealand's temperature could increase by 0.9°C by 2040 and 2.1°C by 2090, above the average for 1980–2000. He writes:

*“For New Zealand, the resulting impact of changes in wind patterns, precipitation, and the chemistry of our oceans can be expected to be at least as significant as the changes in temperature itself. Such changes are not expected to be uniform across New Zealand; there may be pronounced differences between the North and South Islands and between the East and West coasts, and there are also likely to be unequal and important effects on seasonal patterns of rainfall and extreme weather events.”<sup>2</sup>*

The impacts of climate change on Wellington over time could include:

- more frequent extreme storms causing flooding, slips and wind damage
- changing rainfall patterns and increased temperatures leading to pressures on water supplies and public health
- sea-level rise leading to increased coastal erosion and effects on coastal infrastructure.

Sea-level rise is a very important consideration for New Zealand even though the specific rate is difficult to project. While global sea-level has increased on average by about 1.7mm per year over the last century, that rate has increased to 3.5mm per year since the early 1990s.<sup>3</sup> Wellington Harbour has experienced an average rise in sea-level of about 2mm per year over the past 100 years; this includes the contribution from subsidence due to tectonic activity.

The Ministry for the Environment recommends that for planning out to 2090–2099, local government should use a base sea-level rise of 0.5m relative to 1980–1999, but consider the consequences of a 0.8m increase. Longer-term planning should account for further increases of 10mm per year.<sup>4</sup> A report from the Potsdam Institute concluded that each degree of warming would lead to over 2m of sea-level rise in the long term.<sup>5</sup>

## NATIONAL CONTEXT FOR CLIMATE CHANGE MITIGATION

The national context for Wellington City's climate change action continues to evolve. From 2008–2012, New Zealand's target under the Kyoto Protocol was to reduce net greenhouse gas emissions (including forestry) to 1990 gross levels (excluding forestry) on average. The Government expects New Zealand to have complied with this obligation when international reporting concludes in 2015. However, national emissions excluding forestry have increased over 22 percent from 1990–2011, and Kyoto compliance has been achieved largely through domestic forestry and purchasing Kyoto emission units generated from offshore reductions.

The New Zealand Emissions Trading Scheme (NZ ETS), which came into force in 2008, is New Zealand's primary climate change measure. It covers all six greenhouse gases under the Kyoto Protocol and all economic sectors except agriculture (obligations for non-energy agriculture emissions have been deferred). Wellington City Council and other entities in the city with obligations must comply with the NZ ETS. Eligible owners of forest land established after 1989 can opt into the NZ ETS to receive emission units.

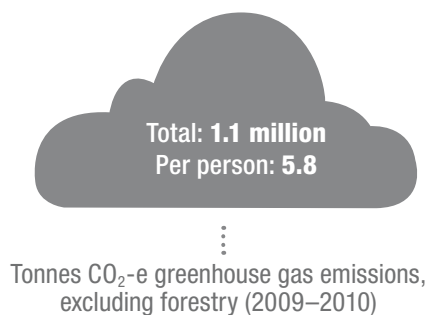

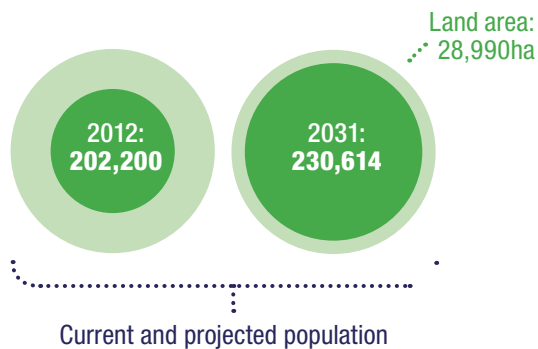

In late 2012, the Government announced that it would not enter into a second commitment period under the Kyoto Protocol, but would instead set a non-binding target through to 2020 under the UN Framework Convention on Climate Change. In August 2013, the Government announced an unconditional emissions-reduction target of 5 percent below 1990 levels by 2020. This is less ambitious than the conditional pledge of a 10–20 percent reduction initially tabled in the negotiations; however, it is possible that during further negotiations New Zealand might increase its target ambition.

Wellington's commitment to climate change action sends an important signal. City leadership and partnerships across the city and at all levels of government will remain critical to meeting Wellington's ambitious greenhouse gas emissions-reduction targets for 2020 and beyond.

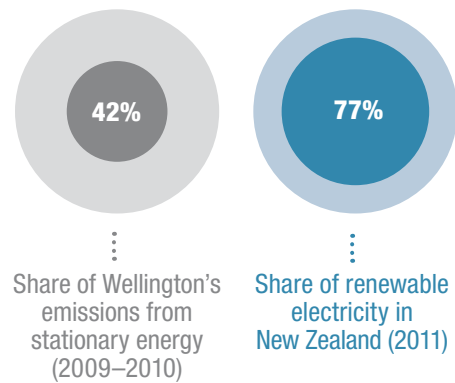

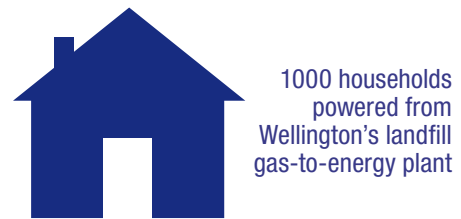

# FACTS AND FIGURES FOR WELLINGTON CITY

## GENERAL

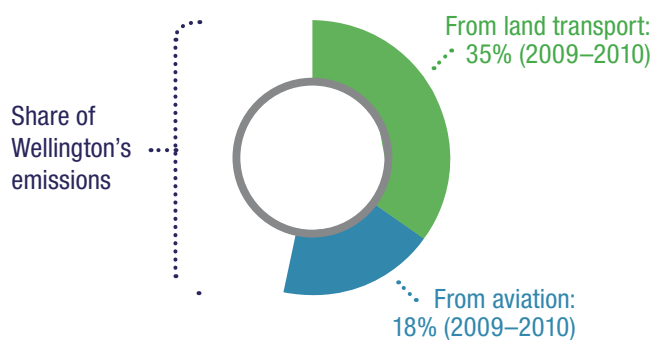

## STATIONARY ENERGY

(eg electricity and heat)

## TRANSPORT ENERGY

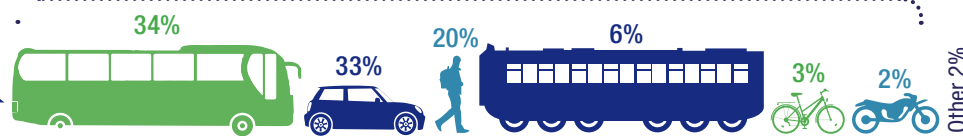

Average number of motor vehicles per household (2006)

Wellington has the lowest among New Zealand cities

1.3

Breakdown of weekly travel into central Wellington (2013)

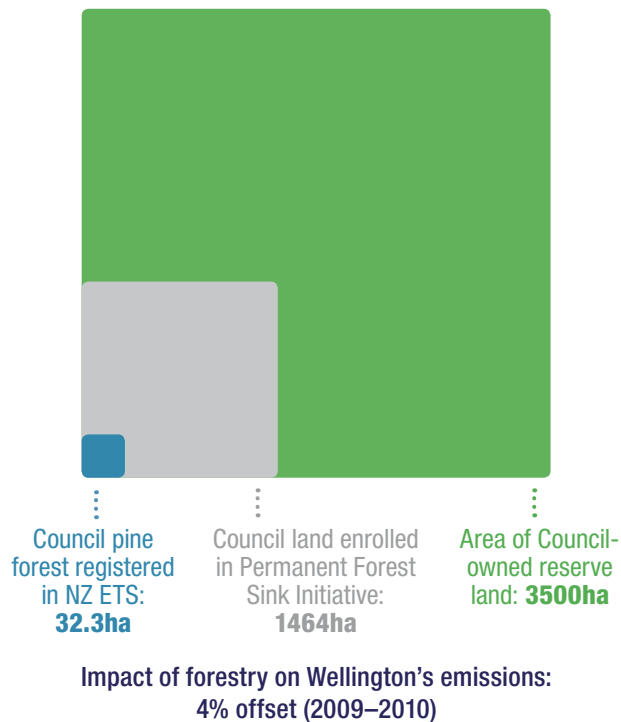

Average distance per person travelled from home to work and back per day: 12.2km (2006)

70%

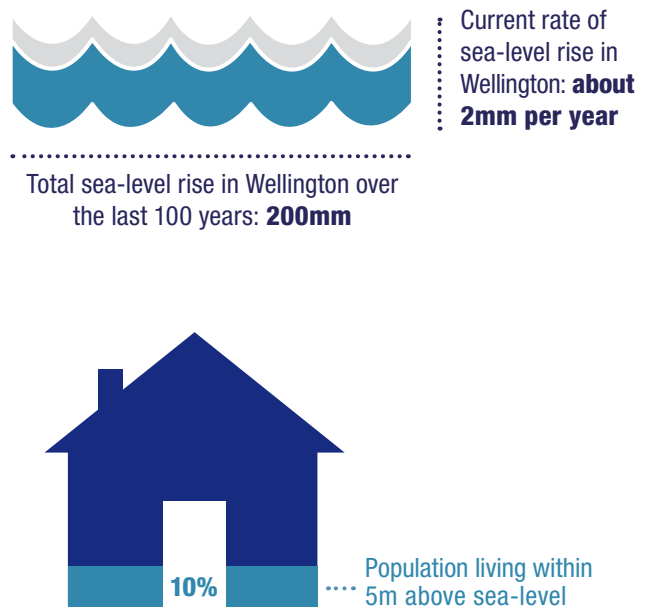

Share of workforce located in central city (2006)

## FORESTS

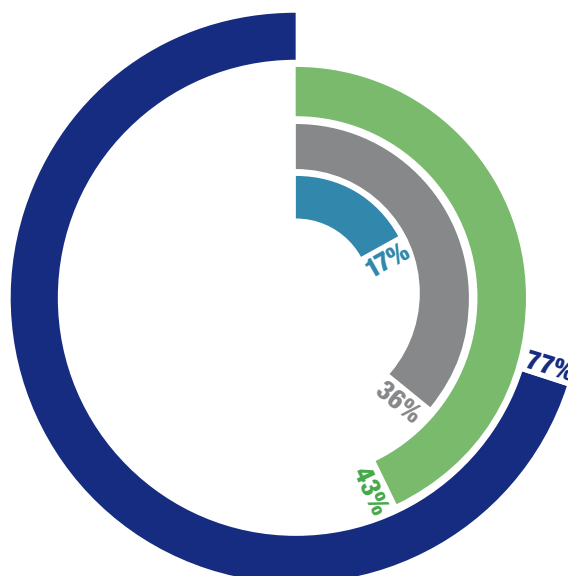

## ADAPTATION

## 2013 WELLINGTON RESIDENTS MONITORING SURVEY

### Share of Wellingtonians who agree or strongly agree

- Wellington is working to reduce its greenhouse gas emissions
- Wellington is well prepared to respond to natural events
- Wellington is taking appropriate action to prepare for long-term sea-level rise

### Perceived proportion of Wellington businesses taking at least some action to reduce their environmental impact

Notes: Carbon dioxide equivalent (CO<sub>2</sub>-e) includes other greenhouse gases besides carbon dioxide. Wellington City inventory data for 2009–2010 are based on best available information and may be revised. Data on sea-level rise include subsidence due to tectonic movement.

## WELLINGTON'S GREENHOUSE GAS EMISSIONS

Most of Wellington's greenhouse gas emissions come from energy used to power homes, commercial buildings and transport. Industrial production, waste management and agriculture are relatively minor contributors. Forests offset about 4 percent of the city's emissions by removing carbon dioxide from the atmosphere.

Overall, Wellington's emissions differ significantly from the national profile; nationally, nearly half of the emissions are methane and nitrous oxide from agriculture, and forests offset nearly 20 percent of emissions.

Wellington City's most recent inventory of greenhouse gas emissions was prepared for 2009–2010 using a methodology developed under the Communities for Climate Protection Programme. The table and graph on the next page give an overview of the city's emissions profile using the best available data at the time of publication.<sup>6</sup> Excluding forestry, Wellington's emissions totalled about 1.1 million tonnes CO<sub>2</sub>-e (carbon dioxide equivalent) in 2009–2010, which was equivalent to 5.8 tonnes CO<sub>2</sub>-e per person per year.

Based on the best available information at the time of publication, the city appeared broadly to have tracked well against the target to stabilise emissions at the 2000–2001 level in 2009–2010. The city's progress against its targets will be formally assessed when revised greenhouse gas inventory data become available from the first quarter of 2014.<sup>7</sup>

It is worth noting that during 2000–2010, the city's population increased by about 20 percent and GDP by about 29 percent, which suggests some decoupling of economic growth and greenhouse gas emissions.

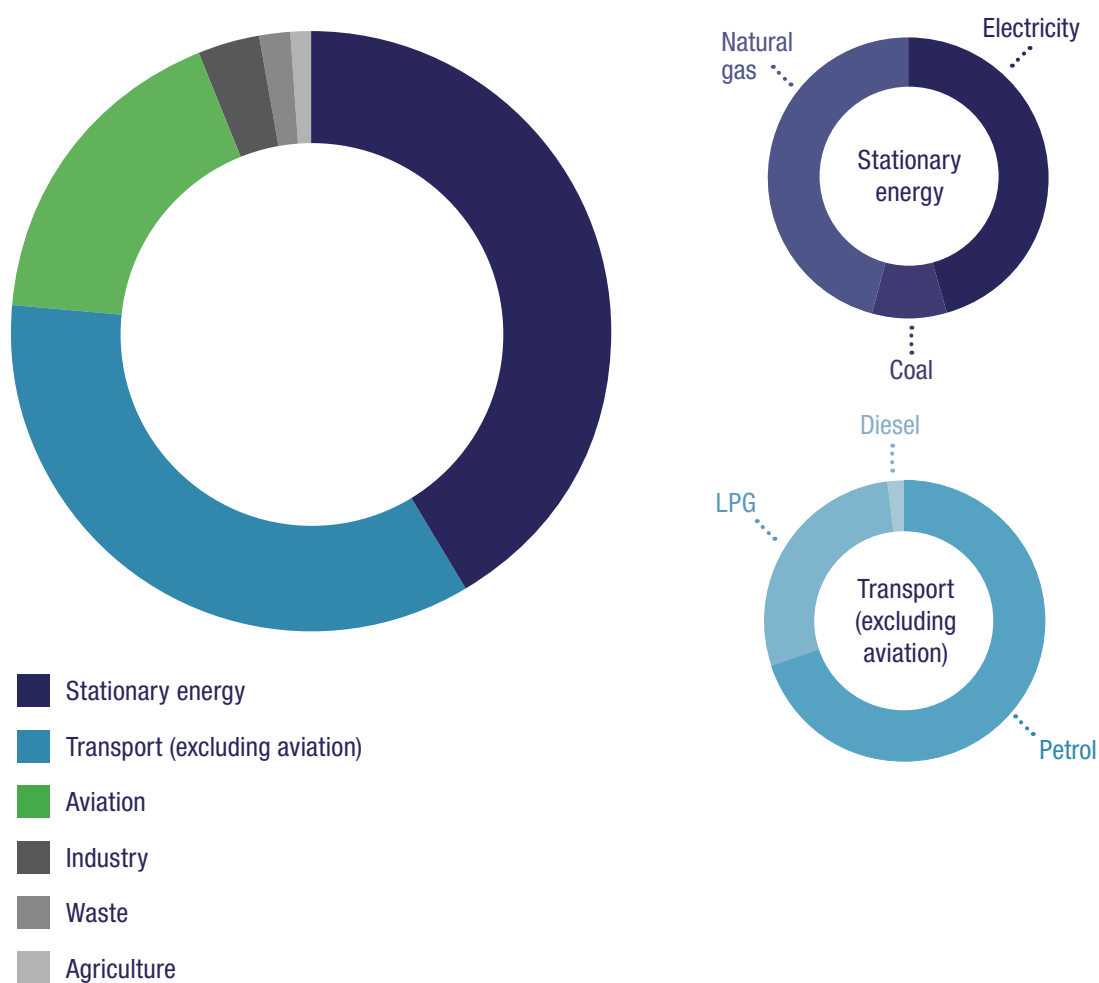

<sup>6</sup> The methodology for Wellington City's inventory diverges from the national GHG inventory in some respects. Due to data limitations, Wellington City's inventory currently reports aggregate emissions from both domestic and international transport fuels; emissions from international transport fuels are reported separately under the national greenhouse gas inventory and excluded from the national emissions-reduction targets. Wellington City's inventory also accounts for all forest carbon stock changes, not just those associated with land uses covered under the Kyoto Protocol.

<sup>7</sup> Methodological differences and data uncertainties may mean that the two current data sets are not fully comparable and further analysis is needed. The assessment that the city was broadly on track against its target for 2009–2010 is supported by key drivers of change: consumption of electricity and transport fuels and emissions from waste.

## Wellington City greenhouse gas inventory 2009–2010

	kT CO <sub>2</sub> -e	% OF TOTAL GROSS EMISSIONS
Stationary energy	475.9	41.6
Transport (excluding aviation)	397.8	34.8
Aviation	199.8	17.5
Industry	39.8	3.5
Waste	17.1	1.5
Agriculture	12.3	1.1
Total gross emissions	1142.6	100.0
Forestry	-48.9	-4
Total net emissions	1093.7	NA

## Wellington City greenhouse gas inventory, excluding forestry 2009–2010

## OVERVIEW OF THE CLIMATE CHANGE ACTION PLAN

The 2013 Climate Change Action Plan builds on the approach taken in 2010. Actions are grouped into seven areas: adaptation, buildings and energy, land transport and shipping, Council operations, forestry, waste and aviation.

We have adapted the 2013 plan to be consistent with the Council's strategy *Wellington Towards 2040: Smart Capital*. Among other goals, this involves strengthening the transition to a low-carbon city, achieving high standards of performance against environmental measures, and integrating 'green' innovation into our economy.

In order to deliver on this strategy, a cross-Council programme – Our Living City – was set up to work on projects that grow and enhance our natural capital, transform our economy, reduce our impact on the environment and show leadership. The Climate Change Action Plan now falls within the scope of Our Living City so it can be integrated with other Council projects.

In 2010, we identified high-level objectives which remain relevant to *Wellington Towards 2040: Smart Capital*. These have been updated with minor modifications:

- resilient communities – Wellington's communities, government agencies and businesses will be well prepared for the impacts of climate change
- centre of excellence – the Wellington region becomes a centre of excellence for urban planning, resilience and ecological sustainability, through partnerships with research institutions and support for clean technology development
- renewable energy – Wellington generates more renewable electricity than we need, with the surplus going to the rest of the country, and supports broader fuel switching to renewable energy (eg for transport)
- growing sustainable transport – Wellington makes the most of its compact form and high use of public transport by concentrating development around existing centres. More people are walking, cycling and using public transport, and making fewer trips by car
- early adopter of electric vehicles – Wellington encourages use of electric vehicles
- green office hub – Wellington's CBD is recognised as a hub for sustainable, energy-efficient commercial buildings and green building design innovation
- warm, efficient homes – Wellington's older housing stock is upgraded to create healthier living environments and more energy-efficient homes

- a city of forests – Wellington continues to expand forest networks on public and private land through natural regeneration of reserves and rural land, plantation forestry, planting in road reserves and tree planting along main streets
- resources from waste – Wellington City and our regional partners develop new approaches to waste management that result in commercially-viable ways of reducing the amount of waste going to landfills and increasing the use of methane to produce energy
- carbon neutral vision – Wellington City aspires to become carbon neutral.

The 2013 Climate Change Action Plan reflects these longer-term objectives for the city but focuses on measures to be achieved from 2013–2015. These measures are supported by budget allocations in the Long-term Plan 2012–2022 and the Annual Plan 2013–2014.

During 2013–2014, we will start engaging with the public to help us plan how the city will achieve its 2020 target and broader goals for reducing greenhouse gas emissions, and how to address city-wide planning in preparation for sea-level rise. The outcome will form the basis of the 2015 Climate Change Action Plan and be reflected in decisions under the Long-term Plan 2015–2025.

# ACTION AREA 1: ADAPTING TO A CHANGING CLIMATE

---

## EXTREME WEATHER EVENTS

*Climate change is impacting on the conditions underlying extreme weather events, with more frequent, higher-intensity storms and periods of drought expected as temperatures increase. The combination of such events with sea-level rise will pose significant challenges to the city.*

*Our resilience has been tested by the experience of extreme weather events over the past year.*

*The summer of 2012–2013 was the driest in over 90 years in Wellington. The pressure placed on regional water supplies, stormwater and sewerage systems was magnified because the city's bulk supply reservoirs were being earthquake strengthened. The estimated cost of the drought to the country was \$1–2 billion.*

*In June 2013, the city was hit by a storm comparable to the 1968 Wahine storm, with significant damage to roads, seawalls and houses. The cost to the city was initially estimated at \$4 million.*

*The winter of 2013 was the warmest in Wellington since records began in the 1860s, with temperatures 1.3°C above average.*

---

Our work on adapting to climate change has highlighted the importance of holistic assessment of the likely impacts and including other major risks or hazards faced by the city – such as earthquakes, tsunamis and storms. Our involvement in resilience programmes with UN agencies, and leadership by the city's research institutions on resilience planning, puts us in a strong position to work collaboratively with a wide range of organisations.

The Council has been recognised for its leading work in this area, particularly on sea-level rise. The Council was on the organising committee for the New Zealand Climate Change Centre's annual conference in May 2012 on sea-level rise, and is a member of the steering committee for the Victoria University series of Climate Change Roundtables. However, much work remains to be done.

Now is the right time for us to begin considering climate change adaptation in all that we do – as a city and as a Council. It is not just an issue for the distant future; there will also be significant short-term impacts. It is not just an issue for city planning; businesses also need to consider how climate change will impact on their business models, supply chains and customer demand.

We have an array of choices in how we respond. For example, in the case of sea-level rise, we can accommodate the changes, enhance natural or engineered defences, or retreat and focus longer-term development in less vulnerable parts of the city.

Planning and decision-making can take some time, so acting early allows time to explore the options and respond appropriately to improve our resilience. We have a vision of becoming a true international centre of excellence in resilience planning.

## PROGRESS: 2010–2012

### SEA-LEVEL-RISE IMPACT ASSESSMENT

We have carried out scenario mapping and modelling, and completed an initial assessment of the likely impacts and response options for sea-level rise. Areas of the city most likely to be affected are low-lying and often on reclaimed land, including the CBD, Kilbirnie, Rongotai, State Highway 2, Miramar and Makara Beach.

Research commissioned in collaboration with Greater Wellington Regional Council has shown that Wellington has the highest rate of relative sea-level rise in New Zealand, as the land is also subsiding. Further research has modelled storm-surge and wave run-up throughout the region, which can be combined with sea-level scenarios to identify the most at-risk areas.

### RESILIENCE AND ASSET MANAGEMENT

The vulnerability of Council assets to the effects of climate change has been assessed, and comprehensive guidance for including climate change considerations in asset management plans has been provided to our asset managers. Guidelines to encourage low-impact urban design are being developed and a new guide to water-sensitive urban design will improve stormwater management through the use of natural drainage and planting. We are continuing to assess the potential for a green roof on the Central Library.

In 2012, Wellington was selected as one of only 10 international cities for the four-year UN-Habitat City Resilience Profiling Programme. This involves developing measures of urban resilience and establishing links between climate change adaptation and natural hazards. Wellington has also been selected by an international scientific committee<sup>8</sup> as a centre of excellence in community resilience research. This will provide opportunities for scientific work in the Asia-Pacific region and put the city on the map for research into community resilience.

### COLLABORATION

We have worked closely on climate change adaptation with other local authorities, particularly on coastal issues, and will strengthen links with Dunedin City Council on coastal erosion and groundwater salination. We are learning from the development of coastal hazard zoning on the Kapiti Coast. A number of councils have sought our expertise, including Auckland, Lower Hutt, Nelson and Tasman, and we have also provided advice to Samoa (via a referral by Local Government New Zealand).

The Council has worked with researchers at Victoria University in the Psychology Department (which surveyed public perceptions of sea-level rise), the Climate Change Research Institute (which held workshops for invited local government participants in Nelson and Tasman districts), and the Institute of Governance and Policy Studies (which runs a regular series of roundtable discussions on climate change).

We have assisted the National Institute of Water and Atmospheric Research (NIWA) in the development of its Urban Impacts toolbox for local government adaptation. Collaboration with central government has included giving presentations on climate change adaptation to the Ministry for the Environment and the Treasury's National Infrastructure Unit, and input into the climate change section of the Environmental Domain Plan by Statistics New Zealand.

---

<sup>8</sup> Integrated Research on Disaster Risk (IRDR) is a decade-long research programme co-sponsored by the International Council for Science (ICSU), the International Social Science Council (ISSC), and the United Nations International Strategy for Disaster Reduction (UNISDR).

## PRIORITIES: 2013–2015

### RESEARCH CLIMATE CHANGE IMPACTS IN WELLINGTON

The science of global warming is clear; however, some of the impacts from climate change are not. For example, with sea-level rise, the potential for damage from storm surges, rising water tables and groundwater salination should be considered, but there are gaps in our knowledge regarding these effects.

The Council will continue to work with research institutes on projects related to climate change adaptation and resilience. We are involved in a four-year project with NIWA and Landcare Research, with funding from the Ministry of Science and Innovation, on the impacts and implications of climate change.

As a City Council, we also need to better understand the likely impact of the planning decisions we take (or the implications if we choose not to make decisions and continue with business as usual).

### INTEGRATE ADAPTATION INTO RESILIENCE PLANNING

Planning for climate change adaptation must be considered alongside other natural hazards. For example, a higher water table caused by rising seas may increase the potential for liquefaction in some areas.

It is also more efficient and effective to engage with citizens on wider issues of risk and resilience. When talking with a community about earthquake preparedness, we can include discussions on climate change adaptation and response options. Preparation for tsunami hazard is also relevant to coping with sea-level rise.

While the 2010 plan advocated a city climate change adaptation strategy, the Council is supporting a more holistic approach to city risk management. This is

reinforced by the recent experience with damage from landslides, storms and the July 2013 Wellington earthquakes, including damage to coastal margins at the port and on the south coast.

### ENGAGE WITH THE PUBLIC ON RISK AND RESILIENCE

From 2014 we will engage on risk and resilience with citizens and stakeholders. Using a mix of panel sessions, community displays and discussions, design competitions etc, we will gather ideas from communities which can be shared and will contribute to our asset management investment, review of the District Plan, and the Wellington spatial plan. We aim to:

- increase common understanding of the risks we face
- clarify what decisions will be required, and when
- encourage community discussion and problem-solving
- guide decision-making, with broad public support, on urban planning and economic development.

### IMPLEMENT WATER-SENSITIVE URBAN DESIGN

Water-sensitive urban design will be a big change in how we manage water and urban development. There is also potential for significant cost savings.

This approach to urban design will reduce rainwater inundation of the city's drainage network, flooding and sewer overflows to the sea. In turn it will improve sea water quality, reduce the amount of energy used for water management, bring more native flora and fauna into urban areas and improve quality of life for Wellingtonians.

Water-sensitive urban design principles will continue to be implemented throughout the city. One example is the National War Memorial Park under construction, which will incorporate tree pits and rain gardens to hold and filter stormwater.

# ACTION AREA 2: BUILDINGS AND ENERGY

Stationary energy (ie energy consumption that excludes energy used for transport) accounts for over 40 percent of Wellington's greenhouse gas emissions. These mainly come from burning fossil fuels (eg coal, natural gas and LPG) for electricity generation, heating and industrial production. In Wellington, most of this energy is used to power homes and buildings.

In the Climate Change Action Plan, the buildings and energy sector has three main components:

- emissions from energy used in residential buildings
- emissions from energy used in commercial and industrial buildings
- large- and small-scale energy generation in Wellington.

Wellington has around 70,000 rateable residential units, which include single family homes, apartments and townhouses. The city also has several thousand commercial, institutional and industrial buildings – from office buildings, municipal facilities, schools, universities and hospitals to corner dairies.

On the energy-generation side, Wellington is proud to be home to one of the world's most productive wind farms and a new commercial wind farm under construction. We also have potential for more solar and marine generation. While New Zealand typically generates over 70 percent of its electricity from renewable sources (77 percent in 2011), the rest comes from fossil fuels. The electricity that Wellington draws from the national grid reflects the national power mix, and the associated emissions are counted in our city's greenhouse gas inventory.

The buildings sector offers significant potential for a reduction in emissions. The main options in Wellington are to increase renewable generation and improve the energy efficiency of households and businesses.

## PROGRESS: 2010–2012

### COUNCIL-LED INITIATIVES

#### Home Energy Saver programme

With our service provider Home&dry, we have completed free home energy assessments for over 1200 households since August 2011. As part of the programme, we have installed 1400 energy-efficient light bulbs, 400 efficient showerheads and 370 draught-stoppers for doors and windows.

#### Warm Up Wellington

We have worked with the Energy Efficiency and Conservation Authority (EECA), Capital & Coast District Health Board and other funding partners to insulate over 560 low-income homes with our service providers Eco Insulation and Sustainability Trust.

#### Business Energy Saver programme

In 2011, the Council entered into a funding partnership with EECA as part of their Energising Business programme. This involved supporting businesses to undertake energy assessments and energy retrofits. There was very little uptake of the programme in Wellington, which reflects a national trend. We have since focused our business partnerships in other areas, as discussed below.

#### Encouraging renewable energy

We have initiated several projects to encourage and promote the uptake of renewable energy technology, including:

- new rules in the District Plan to exempt solar panels from requiring a resource consent (which applies to most installations)
- new rules in the District Plan to allow small-scale wind turbines of less than 5kW in residential areas, providing they comply with noise and height requirements
- creating a solar map that allows residents, businesses and other users to calculate the solar energy potential of their rooftops.

## WHAT OTHERS ARE DOING

### Green buildings

Wellington has eight Green Star-rated commercial buildings and three offices that have received Green Star ratings for office fit-outs. The city is home to the first ever Green Star-rated building in New Zealand, the first 6-Star-rated office fit-out and the first 5-Star-rated building from a building renovation. Since 2007, nearly 95 percent of the net leasable area of newly-constructed office buildings of A-grade and above has been Green Star-rated.<sup>9</sup>

The city's universities are also leading the way with innovative building designs. Victoria University's Alan MacDiarmid Building won a gold award for excellence for its heating and ventilation system, and Massey University's new, award-winning College of Creative Arts building, Te Ara Hihiko, uses world-leading seismic engineering technology and passive heating and cooling.

### Warm Up New Zealand

EECA's Warm Up New Zealand: Heat Smart programme started in July 2009. Up until June 2013 more than 12,000 Wellington homes had insulation installed or topped up and around 2160 homes received a clean-heat retrofit.

Including the substantial health benefits from insulating homes, the benefit/cost ratio of Warm Up New Zealand has been assessed at 3.6.<sup>10</sup>

### Renewable generation

Wellington already has a significant renewable energy resource with Meridian Energy's Project West Wind. Located 7km from the city centre, this 62-turbine, 142MW wind farm last year produced 475GWh of electricity – enough to power 71,000 average homes (roughly covering Wellington's residential demand).

Meridian Energy has also commissioned work on the Mill Creek wind farm.

The 26-turbine project in Ohariu Valley will generate up to 59MW. Unlike Project West Wind, which feeds into the national grid, the Mill Creek wind farm will feed directly into the Wellington grid through the Otari sub-station.

On a smaller scale, the Brooklyn wind turbine operates with a 0.225MW capacity (enough to power about 80 homes) and the Southern Landfill gas generator has capacity of 1MW.

### Low-carbon technologies

Business owners in Wellington are starting to invest in low-carbon technologies. Examples include:

- food wholesaler Moore Wilson's has installed a 25kW solar array to help power its operations
- the Wharewaka building on Wellington Waterfront uses a seawater heat pump to heat the building.

### Marine energy testing centre

The Heavy Engineering Research Association (HERA) is taking the lead on setting up a marine energy testing centre, which would test devices for potential energy generation off the Wellington coastline.

The Council provided a grant for HERA to develop a business case that will be submitted to the Government later this year. HERA is working with international companies and organisations for sponsorship and to identify potential customers for the centre (should it be implemented).

<sup>9</sup> Prins, H. 2013. The Attributes of Wellington's Green Buildings: Phase One. Report from the School of Architecture, Victoria University of Wellington to Wellington City Council. Wellington.

<sup>10</sup> Grimes, A. et al. 2012. Costs Benefit Analysis of the Warm Up New Zealand: Heat Smart Programme. Report prepared for the Ministry of Economic Development. Available from: [med.govt.nz/sectors-industries/energy/pdf-docs-library/energy-and-the-environment/energy-efficiency/nzif-cba-report.pdf/view](http://med.govt.nz/sectors-industries/energy/pdf-docs-library/energy-and-the-environment/energy-efficiency/nzif-cba-report.pdf/view)

## PRIORITIES: 2013–2015

### IMPLEMENT THE SMART ENERGY CAPITAL FUND

The Council has allocated \$250,000 per year from 2013–2015 to the Smart Energy Capital fund to catalyse energy projects in Wellington.

By partnering with organisations, we will co-fund projects that can be implemented at a significant scale, focus on reducing energy consumption and distributed energy generation, and result in benefits such as improved health or economic development. We have invited interested parties to submit 'expressions of innovation'.

The first two projects are:

- Warm Up Wellington – enabling insulation of 250 low-income homes in the first year by increasing the Council's contribution to \$100,000, thereby leveraging funding of \$650,000 from project partners (see below). Funding for future years will be confirmed
- a three-year partnership with Genesis Energy's Schoolgen programme to install solar photovoltaic (PV) panels in 16 Wellington schools and provide energy management guidance.

### IMPLEMENT NABERS NZ™ (ENERGY EFFICIENCY) BENCHMARKING

We are working with EECA, commercial property owners and tenants to encourage uptake of the NABERS NZ™ energy benchmarking tool, which helps property owners and tenants assess and improve their building's energy performance.

### EXTEND HOME ENERGY SAVER

The Home Energy Saver programme will continue through to 2015 with some refinements. We are working with banks, energy companies, energy specialists and social enterprises to explore a more integrated approach to the home assessments, combining energy and water efficiency, earthquake resilience and potential for renewable energy generation such as solar power.

### EXTEND WARM UP WELLINGTON

We are continuing to work closely with EECA, Capital & Coast District Health Board and the Sustainability Trust as our service provider, so that more low-income homes can be insulated under the Warm Up scheme.

### DEVELOP A RENTAL HOUSING WARRANT OF FITNESS

Work is under way with our partners in local government, research institutions and the health sector to develop a voluntary warrant of fitness tool for rental housing. If the tool is developed, we would run a pilot programme for stand-alone Council housing and responsible landlords.

### ENCOURAGE UPTAKE OF SOLAR ENERGY

Banks, energy companies and solar panel installers are setting up new financial products to make solar technology more affordable. We are working with the various partners to see how we can help to encourage uptake of solar energy.

# ACTION AREA 3: LAND TRANSPORT AND SHIPPING

Greenhouse gas emissions are generated by the use of fossil fuels such as diesel, petrol and LPG for road transport and shipping. Emissions can be brought down by reducing traffic congestion and the number of car journeys (eg by carpooling and increasing use of public transport as well as walking and cycling), improving how we drive, using more fuel-efficient vehicles, and switching to low-carbon fuels such as renewable electricity and biofuels.

Transport is one of the Council's strategic priorities, with funding made available for projects on walking, cycling and public transport as well as urban transport planning. Encouraging people to use less fuel not only reduces the city's greenhouse gas emissions but also improves people's health and safety, reduces noise and vehicle operating costs and makes the city less reliant on oil supply. We also work with regional and central government to prioritise, fund and implement major transport projects.

New Zealand has 103 registered electric cars (as of June 2013); 23 are in the Wellington region. The region's rate of ownership of electric cars and motorcycles is about twice the national average. Use of electric motorcycles, scooters and bicycles has grown significantly in the city in recent years.

## PROGRESS: 2010–2012

### PUBLIC TRANSPORT, WALKING AND CYCLING

To help speed up bus travelling times and reduce congestion, more bus lanes have been installed along the Golden Mile and on other main bus routes. Real-time information screens also help to provide a more reliable service. More bus shelters have also been installed. Cycle lanes have been extended and cycle boxes installed in parts of the city.

The Council supports targets for increased public transport use as identified in the Regional Land Transport Strategy, and has partnered with Greater Wellington Regional Council and the New Zealand Transport Agency (NZTA) in the development and implementation of the Ngauranga to Airport corridor plan. We are involved in the development and delivery of the Regional Land Transport Programme.

### COMPACT CITY DEVELOPMENT

The urban growth corridor continues to consolidate, and aligns with public transport routes. Recent work to improve infrastructure, redesign roads and implement policies that encourage more mixed-use and higher-density development has occurred in the central city, Kilbirnie, Johnsonville and Miramar. The city also benefits from improvements to broadband infrastructure, which gives more people an opportunity to work from home, easing pressure on transport infrastructure.

In 2012, an initial progress review under the 2006 Urban Development Strategy found less greenfield and low-density development than predicted (22 percent compared to a projected 34 percent), more high-density and apartment growth (41 percent compared to a projected 36 percent), and more medium-density infill (37 percent compared to a

projected 30 percent). This indicates a changing pattern of settlement in Wellington and emphasises the growing demand to live near convenient urban centres. In turn this encourages more people to walk and cycle, and reduces car dependency and greenhouse gas emissions.

## NEW FUELS AND TRANSPORT TECHNOLOGY

We led a pilot project with business partners to trial eight Mitsubishi i-MiEV electric cars. Our partners included New Zealand Post, The Wellington Company and Meridian Energy, and Z Energy installed an electric vehicle charging post. The Council continues to run one pure electric car as part of its vehicle fleet.

EECA assisted with monitoring and analysis of vehicle use, including a survey of users showing overwhelming support. We also worked with EECA and others to develop an online tool for comparing the costs of running electric vehicles and petrol- or diesel-powered vehicles. The Council ran a successful electric vehicle display outside Te Papa in June 2012, featuring a range of electric cars, motorcycles, scooters and bicycles.

We have also tested biofuels in some of our fleet vehicles. We are monitoring progress in the development of more advanced biofuels technologies.

## FINANCIAL MECHANISMS AND GOVERNMENT STANDARDS

The Council has advocated to regional and central government for more efficient transport operations, including improved infrastructure for all modes, higher fuel-efficiency standards, electric vehicles, ethical biofuels, investigating road-pricing regulations and investment in public transport networks.

## PRIORITIES: 2013–2015

### IMPROVE PUBLIC TRANSPORT AND ROAD NETWORKS AND ENCOURAGE WALKING AND CYCLING

We will review and update the Wellington Transport Strategy to reflect the city's desired outcomes for transport, land use and spatial planning.

City Councillors have requested an emphasis on travel demand management, emergency and freight priority, better facilities for walking and cycling, and improved public transport to provide real transport choices for more people.

The Council will also identify opportunities to enhance walking, cycling and public transport alongside Roads of National Significance projects within Wellington.

We will collaborate regionally on continued improvements to public transport resulting from the Public Transport Spine Study. This study, commissioned jointly by Wellington City Council, Greater Wellington Regional Council and NZTA, assesses possible future public transport options for Wellington, including bus priority, bus rapid transit and light rail. The study was completed in June 2013 and released for public consultation.

Consistent with the Ngauranga to Airport Corridor Plan, construction of the Basin Reserve bridge is planned within this period. The bridge is seen as a significant opportunity to ease congestion and improve public transport to the southern and eastern suburbs.

### SUPPORT COMPACT CITY DEVELOPMENT

The Council will continue to support compact development in the city, which can reduce travel demand. This will be addressed in the updated Wellington Transport Strategy, the Urban Development Strategy and review of the District Plan.

The Council is working with Victoria University and the New Zealand Centre for Sustainable Cities to assess the benefits and costs of trends in housing demand towards centres which offer more compact, mixed land use and better access to amenities, goods and services.

Consistent with the 'connected city' goal of *Wellington Towards 2040: Smart Capital*, the Council will also continue to assess opportunities for improved telecommunications technologies and infrastructure to reduce travel demand.

### PROMOTE EFFICIENT VEHICLE TECHNOLOGY AND LOW-CARBON FUELS

Our support of innovation in vehicle and fuel technologies will continue. This includes encouraging more businesses to add electric vehicles and bicycles to their fleets, and assessing requirements for electric vehicle-charging infrastructure.

As part of this, we are working with stakeholders to set up a consortium of fleet operators to purchase electric vehicles in bulk. With combined buying power, the consortium would aim to reduce capital or lease costs for electric vehicles to make them more affordable. The feasibility of this project is being assessed.

We will also work with Centreport on options for reducing greenhouse gas emissions from shipping through efficiency improvements and fuel switching.

## ACTION AREA 4: WASTE

When organic waste breaks down in a landfill it produces methane, a greenhouse gas which is 25 times more damaging to the atmosphere than carbon dioxide over 100 years.<sup>11</sup>

Emissions from waste in landfills are only a small proportion of Wellington's emissions (around 1 percent). The Council has direct liabilities for those emissions under the NZ ETS because we own the Southern Landfill in Brooklyn and part-own (22 percent share) the Spicer Landfill in Porirua. Both landfills capture and burn methane to reduce its impact as a greenhouse gas – the Southern Landfill uses it to generate electricity for Wellington.

In the 2013 Siemens Green City Index study for Australia and New Zealand, Wellington drew recognition for having the lowest rate of waste generation in the region (250kg per person per year compared to the average of 427kg), and the highest recycling rate (53 percent compared to the average of 42 percent).<sup>12</sup> However, countries in other regions have achieved even better results and we can continue to improve.

## PROGRESS: 2010–2012

### KAI TO COMPOST

We have expanded our Kai to Compost service to attract more customers, make the service profitable and increase the amount of food waste collected. Kai to Compost now operates seven days per week and the number of customers has doubled since June 2010. Z Energy uses Kai to Compost at all of its Wellington sites and Westfield Queensgate shopping centre has also joined.

### NEW ZEALAND EMISSIONS TRADING SCHEME

Liability for emissions from the waste sector under the NZ ETS began in 2013. The Council is fulfilling its requirements as a landfill owner and recording data from our landfill gas generation system so we can apply for a unique emissions factor from the Ministry for the Environment and more accurately account for our emissions. Once our unique emissions factor is agreed, we can formally publish our NZ ETS emissions liability for waste.

### NEW RECYCLING SYSTEM

We have introduced a new split recycling system for Wellington households that separates glass from other recyclables. The new system makes all of the recycling material collected more valuable as a commodity and makes kerbside recycling more financially sustainable.

All paper and glass collected are reprocessed in New Zealand, adding to the country's economic base and reducing global emissions from shipping to Asia. In addition, because the glass is separated by colour at the kerb, less processing is required at the glass recycling plant, which uses less energy.

<sup>11</sup> As reported by the IPCC Fourth Assessment Report. See [ipcc.ch/publications\\_and\\_data/ar4/wg1/en/ch2s2-10-2.html](http://ipcc.ch/publications_and_data/ar4/wg1/en/ch2s2-10-2.html)

<sup>12</sup> Economist Intelligence Unit. 2013. Australia and New Zealand Green City Index: Results for Wellington. Munich: Siemens AG.

## **SEWAGE SLUDGE PYROLYSIS TRIAL**

With Kapiti Coast District Council, we co-funded SpecionNZ, a company based at the Otaki Clean Technology Centre, to trial a new method of treating sewage sludge using pyrolysis technology. Pyrolysis uses microwaves to heat the sludge, which produces methane gas and bio-char. The main conclusion was that pyrolysis could not process Wellington's sewage sludge because of its moisture content and the Council decided not to invest in this any further.

## **REGIONAL WASTE MINIMISATION AND MANAGEMENT**

The Council agreed on the Wellington Regional Waste Minimisation and Management Plan, which contained several actions aimed at reducing the amount of organic material going to landfills. These are discussed further below.

## **WASTE PROGRAMMES FOR SCHOOLS AND NOT-FOR-PROFITS**

The Council is providing recycling services for schools, preschools and not-for-profit organisations, as well as education on waste and composting for primary and intermediate students.

## **ENVIROCOMP NAPPY RECYCLING**

Residential and commercial customers can now access the EnviroComp nappy recycling service at several drop-off points in Wellington. The Council subsidises the service in Wellington to encourage more people to use it.

## **PRIORITIES: 2013–2015**

Under the Wellington Regional Waste Minimisation and Management Plan, the Council will work with the Wellington Regional Waste Forum on the following projects.

### **INVESTIGATE IMPROVED METHODS OF SEWAGE SLUDGE TREATMENT**

Technologies for converting sewage sludge to energy or other valuable by-products are becoming more common in other countries. Starting in 2015, a business case will be investigated for developing new sewage sludge treatment/disposal techniques.

### **DEVELOP A REGIONAL WASTE EDUCATION STRATEGY**

The strategy would be agreed with the Waste Forum and include public education on home composting, worm farms and other ways to reduce organic waste going to landfills.

### **IMPROVE PACKAGING PRODUCT STEWARDSHIP**

We will jointly lobby the Government to introduce a national packaging product stewardship scheme, which would cover the organic materials of paper and cardboard.

### **EXPAND KAI TO COMPOST**

We will continue to market and expand our Kai to Compost service.

### **INCREASE E-WASTE RECYCLING**

In July 2013, the Council announced a new partnership with e-recycler RemarkIT enabling Wellingtonians to dispose of most e-waste for free at the Southern Landfill's recycling centre. This partnership is the first of its kind in New Zealand. Recycling e-waste components helps to reduce manufacturing emissions compared to using new materials, while diverting waste with hazardous components from landfills.

# ACTION AREA 5: COUNCIL OPERATIONS

The Council owns, manages and provides a range of community services that directly or indirectly produce greenhouse gas emissions. The major sources of emissions for Council operations are the landfills and the energy used to run our offices, pools, water treatment and pumping, streetlights and vehicle fleet.

We are working towards the following emissions-reduction targets:

- reduce emissions by 40 percent below 2003 levels by 2020
- reduce emissions by 80 percent below 2003 levels by 2050.

These targets include the Council Controlled Organisations: Basin Reserve Trust, Capacity, Positively Wellington Tourism, Positively Wellington Venues, Wellington Cablecar, Wellington Museums Trust, Westpac Stadium, Wellington Waterfront and Wellington Zoo.

## PROGRESS: 2010–2012

### ENERGY MANAGEMENT PROGRAMME

The Council continues to deliver an energy data monitoring system and energy management programme through our Energy Manager. Since June 2010, projects included:

- undertaking energy audits at Newtown Park Apartments, Freyberg Pool and Fitness Centre, and the Civic Complex buildings
- reducing shower flows, automating lighting controls and levels, and installing a thermal blanket on the pool at the Wellington Regional Aquatic Centre.

### VEHICLE FLEET

We have introduced GPS tracking technology in our vehicle fleet, which has helped us optimise routes and vehicle numbers. Through monitoring vehicle use, we have removed 22 light vehicles and utilities from the fleet.

A vehicle fleet purchasing policy, which includes minimum standards for fuel efficiency and emissions, has been introduced and, through driver training and fuel-saving measures, we saved over 50,000 litres of petrol from 2009–2013.

As already noted, we trialled electric cars as part of the Council fleet and continue to operate one purely electric car. The Council also has four bicycles available for staff use.

### PROCUREMENT POLICY

The Council's Procurement Policy includes measures to support sustainable business practices and minimise adverse environmental impacts of procurement decisions.

Under standard templates, bidders are asked to supply information about their environmental/sustainability policies, strategies and targets, including steps being taken to reduce greenhouse gas emissions.

The Council's Travel Information Handbook for staff prescribes the purchase of offset units to cover emissions associated with international air travel outside of the European Union, as these emissions are not covered by either domestic or international emissions trading legislation. The cost of offsetting is treated as part of overall trip costs.

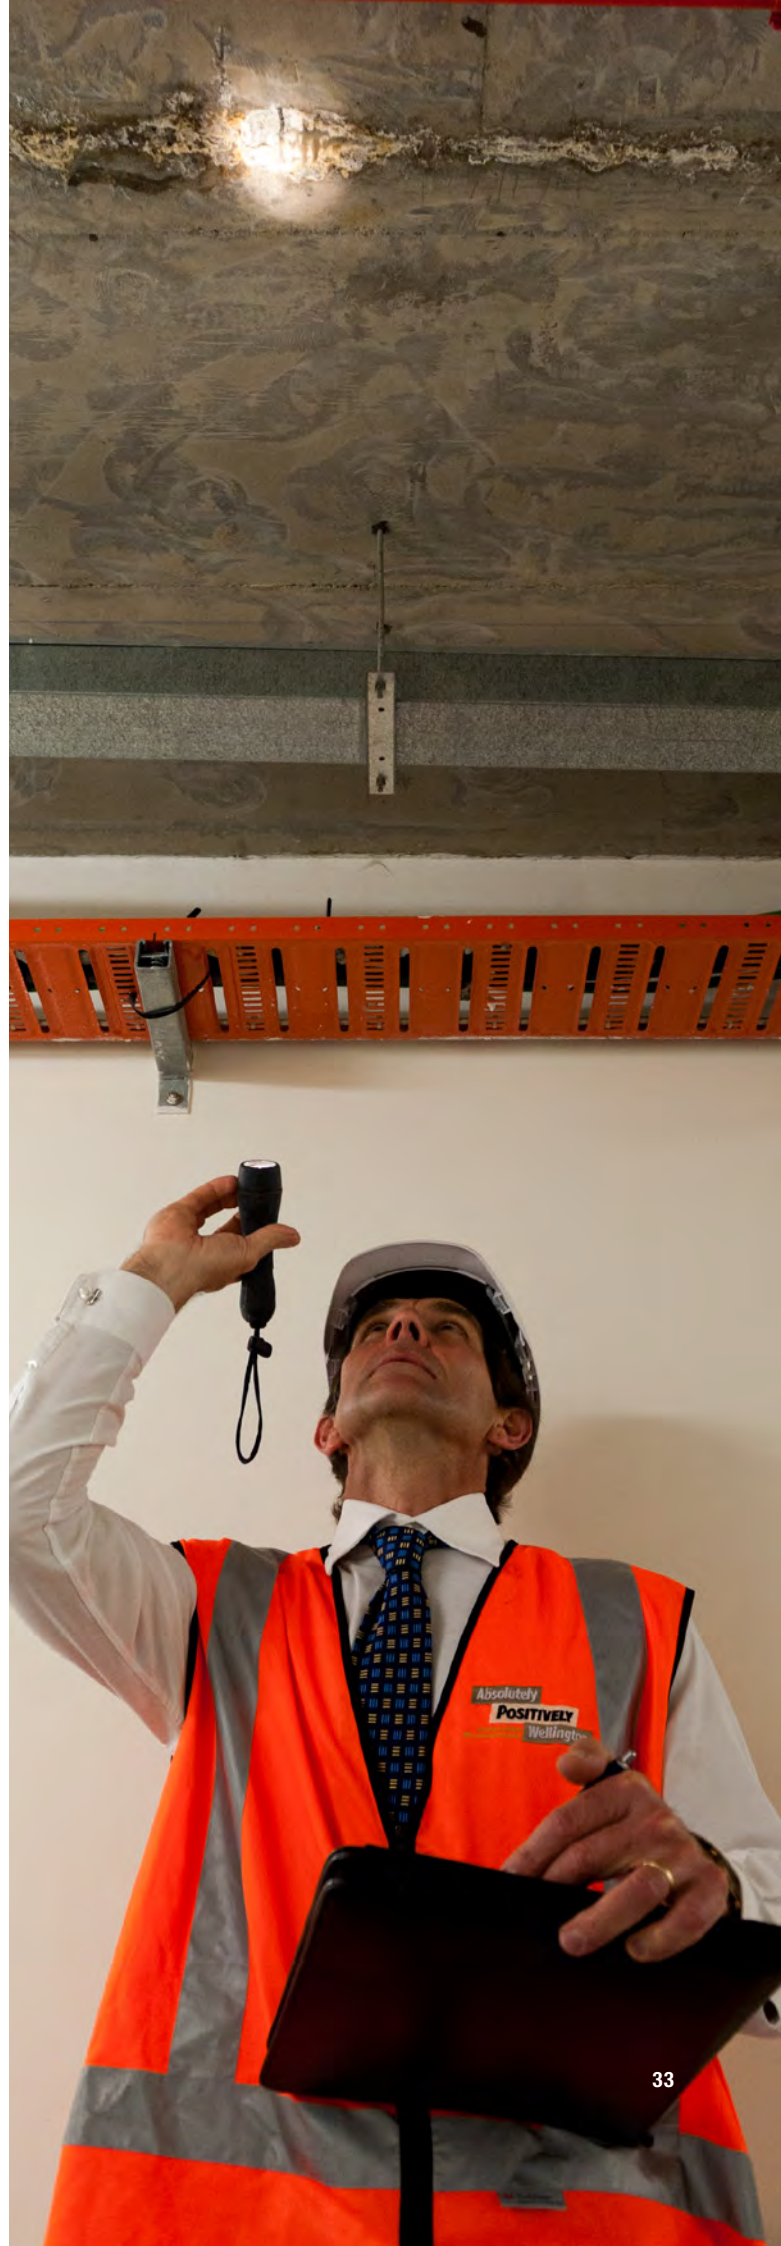

## CARBON MANAGEMENT POLICY

The Carbon Management Policy was produced in 2011 to guide management of the Council's greenhouse gas emission liabilities and holdings under the NZ ETS and the Permanent Forest Sink Initiative.

## WATER CONSERVATION AND EFFICIENCY PLAN

We introduced a Water Conservation and Efficiency Plan in 2011 to manage our water demand in the face of a growing population, uncertainty over changes in our climate and a changing built environment. As part of this, we undertook active water leak detection in Johnsonville, Northland, Roseneath, Brooklyn, Onslow, Wadestown, Woodridge and Kilbirnie, and any leaks found were scheduled for repair.

To help with leak detection, water meters were installed in Newlands and Johnsonville on Horokiwi Road, Fitzpatrick Street, Glanmire Road, Newlands Road and Fraser Avenue to measure flow and pressure. From 2011–2013, water use dropped by 3 percent, or 4015 litres per person per year, as a result of leak detection and public education.

## PRIORITIES: 2013–2015

### OPTIMISE THE VEHICLE FLEET

We plan to further reduce the size of the light vehicle fleet by reducing demand, including more effective carpooling. We will also work to improve driver behaviour to save fuel.

### VERIFY AND BENCHMARK CORPORATE EMISSIONS

The Council will commission independent verification of our greenhouse gas emissions and formally benchmark them using international best practice. This will help us to identify emissions-reduction opportunities and better measure our progress.

At this point, the Council is focusing investment on emission reductions that support Wellington's low-carbon development and generate a return for the city. Consistent with the objectives in the Climate Change Action Plan, we aspire toward carbon neutrality as a Council in the longer term.

### DEVELOP AN ENERGY MANAGEMENT STRATEGY

We plan to develop a Council energy management strategy to reduce energy costs, optimise systems and reduce emissions. As part of this strategy, we will look at models to overcome financing barriers to Council energy projects.

### IMPLEMENT THE KARORI RECREATION CENTRE SOLAR PROJECT

With funding from EECA, we have installed solar PV panels on the roof of Karori Recreation Centre.

### IMPROVE WATER CONSERVATION AND EFFICIENCY

As part of our seven-point plan, we will engage with and educate the wider community, work with large commercial users to help them reduce their water use, and continue our leak detection programme around the city. This will help to reduce water demand and delay the need for additional water sources.

## STRENGTHEN RESEARCH PARTNERSHIPS

As part of Our Living City, the Council will continue to strengthen research partnerships with institutions, including Victoria University, the Otago University Centre for Sustainable Cities, the Centre for Transforming Cities and the UN-Habitat City Resilience Profiling Programme. This will inform Council decision-making in areas relevant to climate change mitigation and adaptation, including urban planning, resilience and ecological sustainability.

## UPDATE THE CARBON MANAGEMENT POLICY

We will update the Carbon Management Policy to maintain and enhance the value of our emission unit assets and manage our emission liabilities according to Council priorities.

---

## WELLINGTON ZOO IS CARBON NEUTRAL

*In 2013, Wellington Zoo became the first zoo in the world to receive carboNZero certification.*

*The zoo was supported with funding from ASB Bank and the Department of Internal Affairs.*

*The zoo commissioned a greenhouse gas inventory, developed a plan to manage and reduce emissions, and committed to offset any remaining emissions.*

*Wellington Zoo's achievement comes after previous recognition for sustainability, including the Central/Southern Sustainable Business Network Sustainable Business of the Year Award and Not for Profit Award, the NZI National Sustainable Business Network People's Choice Award, the Wellington Green Gold Award and the Encore Business Environmental Leadership Award in 2010.*

---

# ACTION AREA 6: FORESTRY

Forests remove carbon dioxide from the atmosphere through photosynthesis. This uptake is sometimes referred to as sequestration and growing forests are referred to as carbon sinks. Under the Government's Permanent Forest Sink Initiative and the NZ ETS, landowners can earn tradable emission units for eligible forests larger than one hectare that were established after 31 December 1989.

As well as managing city-owned forests, the Council also encourages tree planting on private land. Two important considerations for our planting programme are to meet our objectives of biodiversity protection and restoration, and fulfil our kaitiakitanga or guardianship role.

While exotic pine plantations tend to absorb carbon dioxide at much faster rates than native forests, the Council has broader objectives to return parts of the city to native forest. Over the last 10 years, we are proud to have grown, planted and supplied about 700,000 native plants around the city.

## PROGRESS: 2010–2012

### FOREST CARBON SINKS

A number of Council reserves and pine forests have been placed into Government forest-carbon schemes since 2010. The Council successfully registered 1464ha of regenerating native bush under the Permanent Forest Sink Initiative. An additional 32.3ha of post-1989 pine forest were registered with the NZ ETS. The Council also applied for and received a one-off allocation of New Zealand Units for its 212ha of pre-1990 pine forests.

The Council made its first sale of carbon credits (a sale of voluntary units) in 2012. The sale resulted in a net profit of \$100,000 for the Council.

The Council now has a carbon balance of over 137,000 Assigned Amount Units from the Permanent Forest Sink Initiative and over 17,000 New Zealand Units from pre-1990 forests and post-1989 forests registered under the NZ ETS. At the time of publication, carbon prices were near a historic low; however, at a carbon price of \$10 per tonne of CO<sub>2</sub>-e, the Council's carbon assets would be worth over \$1.5 million.

Since 2010, around 200,000 native trees and shrubs have been planted in our parks and reserves, on stream banks, coastal areas and alongside roads. Half of these are planted and looked after by the Council, and the others by community groups, businesses, schools and residents. A number of these planting areas are within Council forests.

### PEST CONTROL

Our work to control browsing animal pests, such as possums and goats, is ongoing in most of our forests to enable increased native regeneration (and therefore increased carbon sequestration).

## PRIORITIES: 2013–2015

### ENHANCE FOREST CARBON SINKS

The Council has set a target of planting two million trees in Wellington over 2003–2020 and is developing partnerships to help meet this target. We will work with our rural communities to promote tree planting to establish forest carbon sinks on private land. We will manage existing forest carbon sinks to maintain effective carbon sequestration. We will also investigate the development of additional forest carbon sinks as a cost-effective way to maintain and enhance our city's valuable forest carbon assets and meet our NZ ETS liabilities.

### EXTEND PEST MANAGEMENT

Pest management programmes will continue so that native forests can regenerate and increase carbon uptake. We will investigate funding opportunities to extend pest management within some of our forests (particularly possum control in Te Kopahou Reserve overlooking Cook Strait).

### ENHANCE LOCAL GOVERNMENT FORESTRY PARTNERSHIPS

We will investigate opportunities to work with other councils on managing forests to increase sequestration and meet associated obligations under the NZ ETS.

## ACTION AREA 7: AVIATION

About 18 percent of Wellington's greenhouse gas emissions come from fuel use in the aviation sector. The Council has no influence on international trends in aviation fuel choice and adoption of efficient aircraft technology. As a shareholder in Wellington International Airport, however, the Council can play a role in encouraging new technology, improved efficiency and market measures.

The Wellington International Airport Master Plan expects passenger numbers to double by 2030 from 5 to 10 million each year although ongoing improvements in aircraft and fuel technologies could help to limit future growth in aviation emissions. Indeed, larger and more modern aircraft (which would require lengthening of the airport runway for operation in Wellington) are also more efficient, resulting in lower average emissions per passenger.

Internationally, the aviation industry has an emissions-reduction strategy, which includes annual fuel efficiency improvements, carbon-neutral growth from 2020, and a halving of net aviation CO<sub>2</sub> emissions by 2050.<sup>13</sup> The strategy targets improved technology, efficient operations and infrastructure, and market-based measures. The industry has so far:

- agreed on a certification and baseline design standard for CO<sub>2</sub> emissions from aircraft
- agreed to establish a single global market-based measure to support its goal of achieving carbon-neutral growth by 2020
- demonstrated that alternative fuels are safe and technically sound with operation of over 1500 flights using biofuel blends.

---

<sup>13</sup> See [iata.org/policy/environment/Documents/policy-climate-change.pdf](https://www.iata.org/policy/environment/Documents/policy-climate-change.pdf)

Air New Zealand continues to lead the industry globally; by 2014, it will have the youngest and most fuel-efficient commercial fleet in the world. The airline has cut fuel use by 15 percent through a range of measures, including reducing on-board weight, advocating for more efficient routes, fitting aerodynamic winglets to its fleet, and taxiing on only one engine to reduce fuel burn. The airline's ground operations have also received attention, with vehicles in some centres running on 20 percent biodiesel.

## PROGRESS: 2010–2012

### MEMORANDUM OF UNDERSTANDING ON AIRPORT OPERATIONS

Wellington International Airport has completed a greenhouse gas inventory for all direct airport operations (excluding airline emissions). The Council and the airport entered into discussions on a draft memorandum of understanding with regard to managing aviation emissions and identifying emissions-reduction opportunities within airport operations. It was agreed that such a document should be consolidated with planning and zoning agreements.

### IMPROVEMENTS TO AIRLINE TECHNOLOGY AND FUELS

As noted above, airlines have taken steps to increase their use of fuel-efficient technology, sustainable alternative fuels and investigation of improved flight plans.

## PRIORITIES: 2013–2015

### INVESTIGATE EMISSIONS-REDUCTION OPTIONS UNDER THE PROPOSED EXTENSION OF THE AIRPORT RUNWAY

A proposed extension of the airport runway to enable direct long-haul flight connections with Wellington has been proposed as an economic development measure. The Council will contribute to the cost of resource consents given the important economic benefit that Wellington International Airport brings to the region. The Council will work with the airport to assess the climate change impacts of the runway extension and identify mitigation opportunities.

### DEVELOP AN AGREEMENT WITH WELLINGTON INTERNATIONAL AIRPORT

The Council will continue to pursue a consolidated agreement with Wellington International Airport that addresses multiple aspects of the relationship between the Council, the airport, the city and the region. This would include consideration of climate change mitigation and adaptation.

### ADVOCATE FOR CLIMATE MITIGATION IN THE AVIATION SECTOR

The Council will continue to work with the airport and airlines to encourage the adoption of best practice emissions-reporting. The Council will also support and monitor the development of climate change mitigation measures, including market measures, by the International Civil Aviation Organisation.

# 2020 EMISSIONS-REDUCTION TARGET – HOW WE WILL GET THERE

Actions taken by the Council and others, combined with national circumstances, have helped to constrain Wellington's emissions growth while producing other valuable benefits for the city. They are not sufficient, however, to position the city for meeting its ambitious 2020 emissions-reduction target or achieving longer-term objectives in this plan. This will require a significant change in investment and action across the city.

To help lead this change, the Council will target the areas where the most gains can be made; improve how we measure our progress; increase community ownership, investment and action; and advocate for change in areas outside our direct control. Each of these is discussed here.

## TARGET AREAS WHERE MOST GAINS CAN BE MADE

These could include:

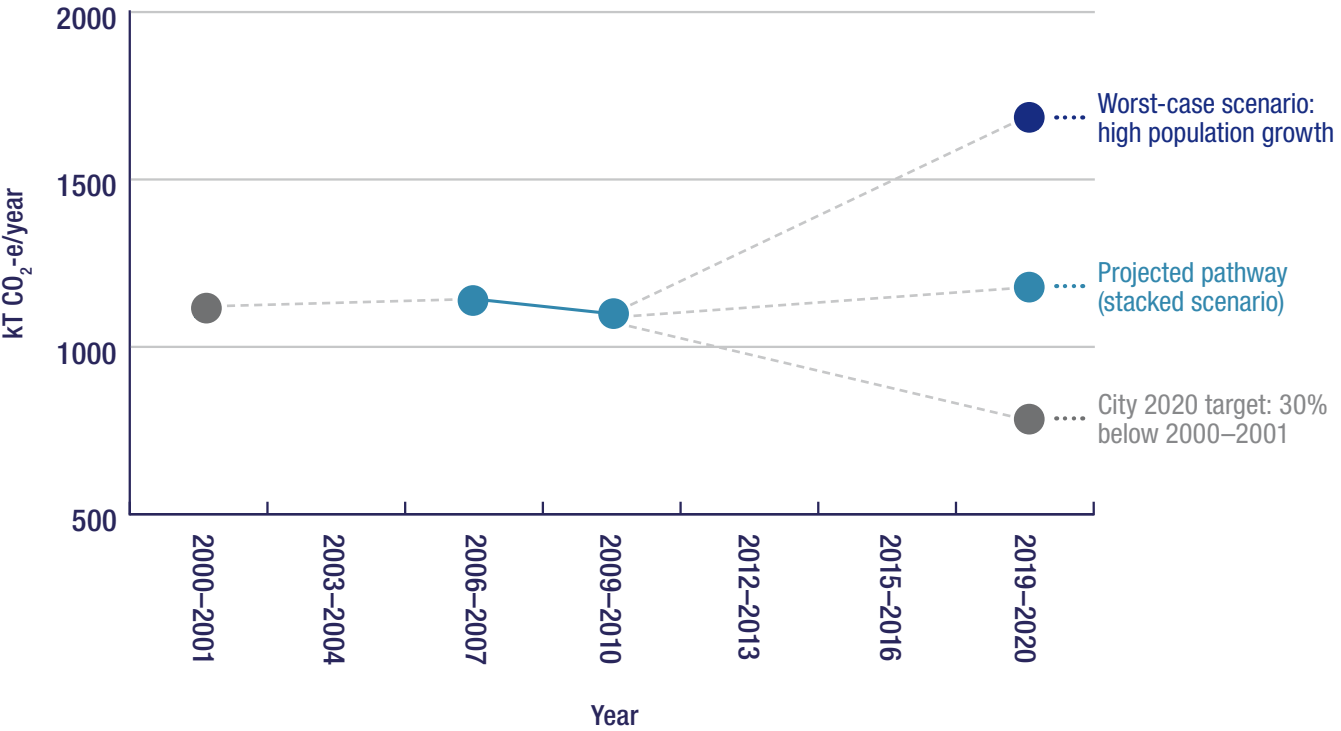

- stationary energy – increased renewable generation including distributed generation, reduced demand from more efficient homes and commercial buildings (existing and new), and efficient supply/demand management with smart grid technology
- transport – increased use of more innovative public transport, more walking and cycling, fuel switching (to renewable electricity and biofuels), vehicle efficiency improvements, and demand reduction (eg carpooling, telecommuting)
- forestry – pest management and increased planting
- compact development – smart land-use planning and mixed-use development to reduce travel and energy demand, and encourage more people to walk and cycle.

Two measures deserve attention. First, increasing the ambition of the NZ ETS would reduce emissions across different sectors, although sectors respond to emissions pricing differently and transport is particularly challenging. Second, the use of smart grid technology could more effectively balance electricity supply and demand, facilitate the uptake of distributed renewable generation, reduce demand for fossil fuel generation and support the transition to electric vehicles powered by renewable energy.

Other incentives for these changes could include other forms of electricity, transport, waste and water pricing; regulations; facilitative or voluntary measures; public/private partnerships and educational programmes. Some of these could be controlled or influenced by the Council but others would likely be directed by central and regional government. The Council should also reinforce connections between its own strategies to mitigate and adapt to climate change.

The diagram below illustrates how various interventions could stack up over time to reach the 2020 target, relative to a hypothetical emissions projection under business-as-usual. A participatory process could be used to develop an agreed emissions-reduction scenario for Wellington.

Wellington’s target pathway: the wedge

## MEASURE OUR PROGRESS

There are limitations to the greenhouse gas inventory data and methodologies used by the city and the Council. City and corporate inventories are inherently more difficult than national inventories because of data collection and boundary issues.

In mid-2013, the Council launched a joint effort with other regional and territorial authorities to develop an updated greenhouse gas inventory and projections for the Wellington region.

As part of this, the region joined an international pilot project to apply the Global Protocol for Community-Scale Greenhouse Gas Emissions, which is led by the World Resources Institute, C40 Cities Climate Leadership Group and ICLEI Local Governments for Sustainability, and is emerging as best international practice.

The regional approach supports leveraging funding, data and expertise and ensuring consistency in methodologies, all of which will encourage collaboration. As noted above, we are also working to improve our own corporate inventory.

## INCREASE COMMUNITY OWNERSHIP, INVESTMENT AND ACTION

The Council will not be able to achieve the 2020 and later targets on its own. In the coming year, we will start engaging with the public and stakeholders to develop an approach for meeting the target and broader climate change goals that is technically and economically viable, and results in other positive outcomes for the community.

## ADVOCATE FOR PROGRESS BEYOND WELLINGTON

Wellington City's ambitious climate change goals point to the need for supporting policies from regional and central government, particularly in transport, energy and planning. The Council will advocate for the adoption and strengthening of policies that support climate change mitigation and adaptation.

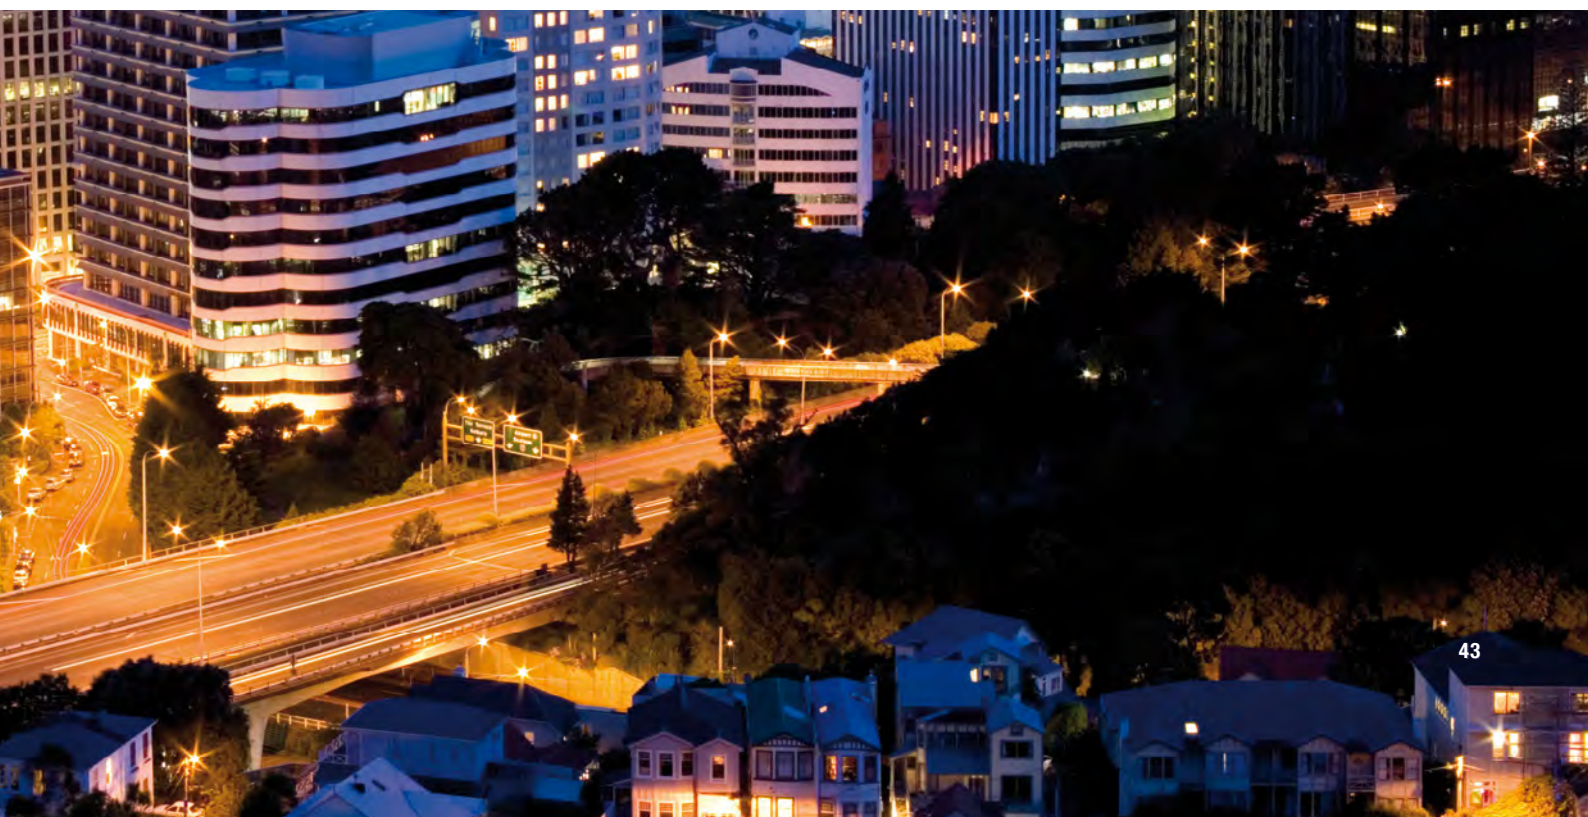

---

## ***BUSINESS ACTION ON CLIMATE CHANGE***

*Many businesses are taking action on climate change, whether by improving the resilience of their business models and supply chains to climate impacts, reducing their emissions and their exposure to higher energy costs and emissions pricing, tapping into new markets for low-carbon technologies and services, or engaging in triple-bottom-line reporting. Business commitment to effective climate action can attract new customers.*

*One initiative supporting voluntary business action to reduce emissions is the carboNZero programme administered by Landcare Research. It offers two levels of independent certification: CEMARS for emissions measurement and reduction planning, and carboNZero for carbon neutrality through offsetting remaining emissions. In Wellington to date, four firms have received CEMARS certification and 11 firms have received carboNZero certification, the latter offsetting over 6500 tonnes of CO<sub>2</sub>-e in their most recent year of certification. Under current accounting, offsets purchased outside the city do not contribute to Wellington's greenhouse gas targets but are supporting global progress.*

---

# WELLINGTON'S INTERNATIONAL CONNECTIONS

Recognising the important roles of cities in providing global leadership on climate change, Wellington City has joined a number of international projects to help with information sharing and collaboration. These include:

- World Mayors Council on Climate Change  
[worldmayorscouncil.org](http://worldmayorscouncil.org)
- carbonn® Cities climate registry  
[citiesclimateregistry.org](http://citiesclimateregistry.org)
- Carbon War Room  
[carbonwarroom.com](http://carbonwarroom.com)
- Urban Climate Change Research Network  
[uccrn.org](http://uccrn.org)
- UN-Habitat Cities Resilience Profiling Programme  
[unhabitat.org](http://unhabitat.org)
- UNISDR Making Cities Resilient Campaign  
[unisdr.org/campaign/resilientcities](http://unisdr.org/campaign/resilientcities)

# COUNCIL BUDGET FOR CLIMATE CHANGE ACTION

The total budget and actual expenditure for implementing the Climate Change Action Plan are difficult to measure because the actions are integrated with Council operations (eg infrastructure, transport, waste, energy, water, biodiversity, land-use management, procurement). Since 2010–2011, the Council has allocated funding to specific measures in the Climate Change Action Plan. These are summarised below.

## Council expenditure specific to the Climate Change Action Plan

	CATEGORY	EXPENDITURE (\$000)					TOTAL
		2010–2011	2011–2012	2012–2013	2013–2014	2014–2015	
Adaptation	OPEX	30	100	100	100	100	430
Buildings and energy	OPEX	25	125	100	100	100	450
Smart Energy Capital	OPEX				250	250	500
Land transport	OPEX	50	50				100
Council operations	OPEX	25	25				50
	CAPEX	50	150				200
Total		180	450	200	450	450	1730

# CONCLUSION

All cities facing the reality of climate change are struggling with the size of the problem and the challenge of balancing the needs of present and future generations. The Climate Change Action Plan sets out our intention to shape development in ways that achieve important gains for the city while reducing our carbon footprint and improving resilience. These goals are ambitious. Our success will depend on the actions we take – as individuals, organisations, communities and government – to serve as a positive force for change in and beyond our city.
